

Since Long Island is in fact an island, most of the voice and data, coming from and going to Long Island, goes through Manhattan (New York City). Historically this had made Long Island unsuitable for locating a data center, colocation facility or disaster recovery center. With multiple providers, Manhattan By-pass fiber routes and connectivity to the submarine cable landings this problem has been solved.

Having major fiber optic networks available to our tenants, eliminating the costs and delays of a fiber build allows users the flexibility and an ability to connect to on-net locations on Long Island and New York City with 1025Connect as the common network exchange point. There is no other building on Long Island with that capability.
